

Metadata (Sambi)

Metadata is the technical information required for integration between members in the federation. Members upload their IdP or SP metadata to the federation operator, and the federation operator aggregates all member metadata into the federation metadata. The federation metadata is then signed and published to guarantee the integrity and availability of the metadata.

Members can upload and manage their metadata in [Federationsadmin](#).

For information regarding each environment, please visit the [Environments](#) page.

Validator

Skolfederation provides an external metadata validator to test your metadata against current SAML metadata rule set.
